EXPERIMENT 08

Configuring User Management and Role-Based Access Control in Zoho Creator

Aim

Separate claim intake, verification, approval and audit duties using users, permission sets, roles and sharing rules.

Record status

Existing Blueprint permission evidence is available. The proposed role matrix and independent-user tests remain pending.

Concept

Permission sets control allowed actions. Roles and their hierarchy affect which users can see whose records. Sharing rules can extend record access. Account administrators have broad access, so owner-only checks cannot demonstrate that ordinary users are correctly restricted.

Procedure

1. Open Users and the application access settings. Distinguish live users from developers and account administrators.

2. Define application roles for Claims Processor, Senior Claims Manager and Auditor. Design the hierarchy before assigning users.

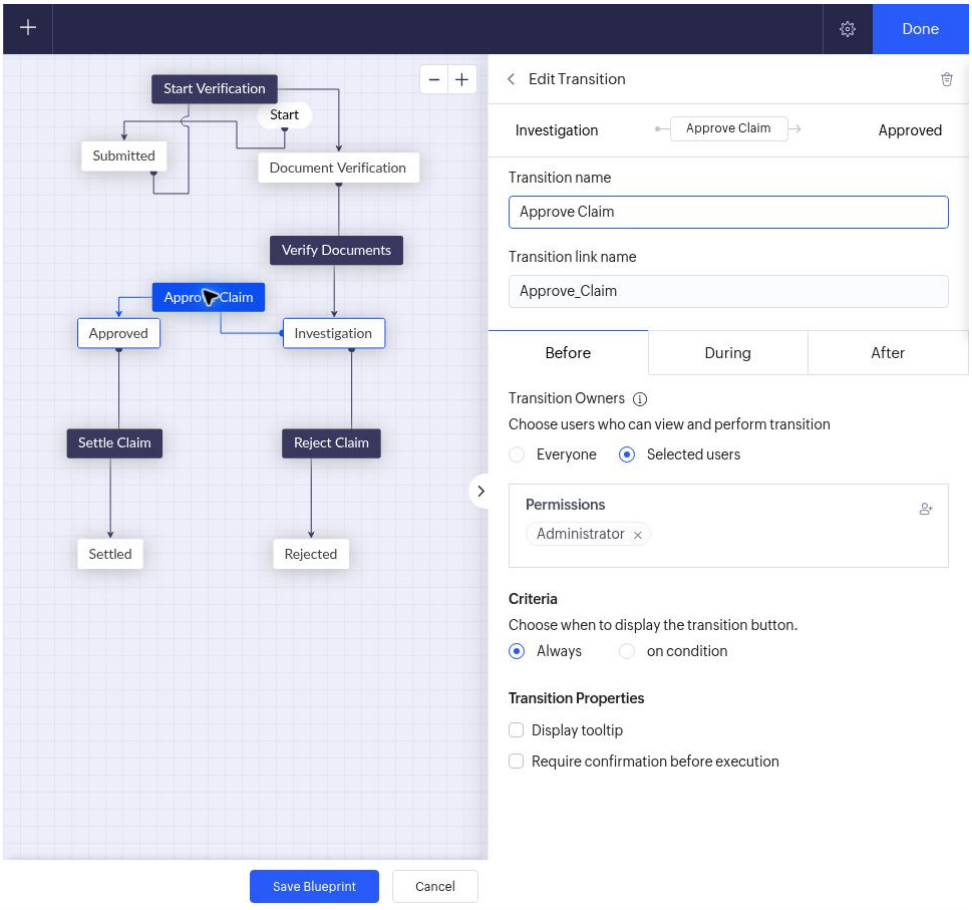

3. Create permission sets with the minimum required form, report, export and API operations. Review any View All or Modify All access.

4. Assign each approved test user an application role and permission set. Add sharing rules only for the records that user needs.

5. Test with independent accounts. Attempt permitted and forbidden operations using both the normal navigation and a direct report URL. Record the actual outcome.

Application design and observations

Proposed role	Intended access
Claims Processor	Create claims; edit assigned open claims; run verification
Senior Claims Manager	Review high-value claims and run authorized decisions
Auditor	Read approved audit views; no edits or approval actions
Application developer	Build and maintain schema; separate from ordinary user tests

Existing configuration evidence: Blueprint transition permission settings. This image does not prove the proposed three-role matrix has been deployed.

The current Blueprint allows Write/Administrator for verification and Administrator for approval, rejection and settlement. The existing high-value edit fallback is owner-only. These narrower observations should be retained until the full role matrix is configured.

Validation and discussion

Test account	Required observation; not yet executed
Claims Processor	Can edit an assigned open claim; cannot approve or settle
Senior Claims Manager	Can review the intended high-value claim only
Auditor	Can read audit view; edit, delete and decision actions denied
Unassigned user	Application access denied or restricted as designed

Result

The RBAC design and acceptance tests are prepared. Existing Blueprint restrictions are documented. Exact Senior Claims Manager assignment, a fallback approver and independent account testing remain unfinished.

Viva focus

Explain the difference between permission sets, roles and record-sharing rules.
