EXPERIMENT 09

Exploring AI-Assisted Features and Built-in Analytics in Zoho Creator

Aim

Explore Zia assistance and examine how built-in reports summarize the fictional insurance claim data.

Record status

Exploration record prepared from observed Zia behaviour and existing live report evidence. A successful new Zia generation is not claimed.

Concept

Zia can assist development using natural-language prompts. Treat generated schemas and scripts as proposals that require review. Reporting produces summaries from stored records and can be checked with manual totals. AI output and report calculations require different validation methods.

Procedure

1. Inspect the available Zia features and selected model provider in the current account. Use a short prompt with fictional data only.

2. Ask for a small form or script suggestion. Check field names, types, required values and compatibility with existing workflows.

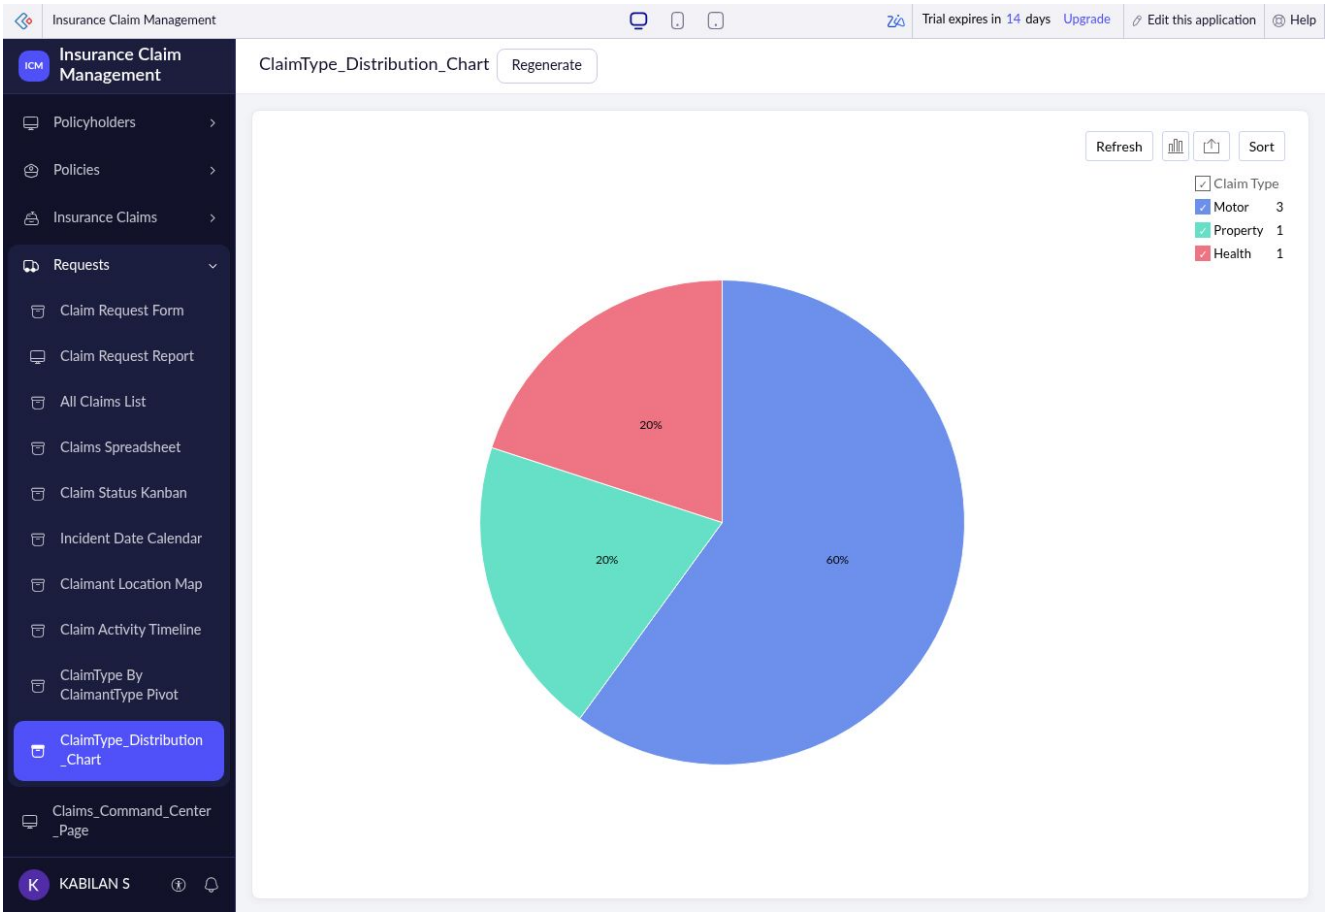

3. If generation fails, retain the error as an observation and finish the schema manually. Do not represent the failed response as a successful build.

4. Open the claim-type chart, pivot and amount summary reports. Apply the same filters before comparing their totals.

5. Check category counts against the underlying list and explain how filtering changes the summary. Avoid using AI text to decide claim eligibility.

Application design and observations

Feature	Observed or proposed use
Zia Build Agent	Earlier data-model attempt reported validation failure
Pie / pivot report	Existing chart groups fictional claims by type
Amount summary	Existing report summarizes entered claim amounts
Human review	Verify generated fields, calculations and report filters

Existing live claim-type chart. This screenshot predates later workflow tests and represents its capture-time data.

The current browser retained a Zia message reporting that the earlier data-model creation failed on auto-number and field-property validation. This is a useful limitation to discuss in the viva. The chart above is conventional built-in reporting, not proof of an Ask Zia analytics session.

Validation and discussion

Check	Observation
Generated model	Failure was observed; successful generation unverified
Report display	Saved screenshot shows a live claim-type chart
Current chart totals	Need recheck after later test-record additions
AI provider / credits	Must be checked in the account before further generation

Result

Zia assistance and built-in analytics were explored. The record includes the observed generation failure and a previously captured live chart. A successful AI-generated form, prediction model or conversational analytics result remains unverified.

Viva focus

Explain why AI-generated output requires review and why chart totals depend on filters.
