Low-code careers and future directions

Experiment 15
Kabilan S

Career pathways

Application developer
Build forms, reports and controlled workflows

Integration developer
Connect services and handle failed requests

Process analyst or platform administrator
Define requirements, access rules and release checks

Skills behind the platform

Data modelling
Related records, validation and accurate calculations

Deluge and APIs
Reusable functions, OAuth and error handling

Testing and governance
Independent user tests, audit review and recovery

Portfolio evidence

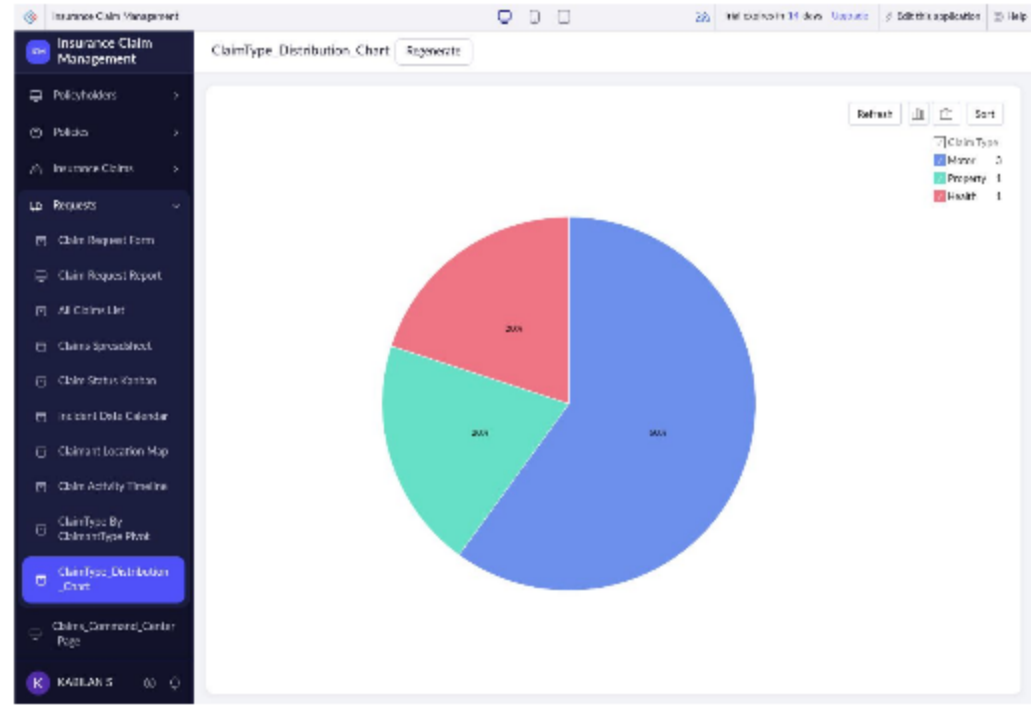

Insurance Claim Management

Related forms and claim reports

Deluge workflows with test results

Clear labels for simulated payouts

A reproducible demo and stated limits

AI-assisted development

Current capability
Zia can assist with application design and scripts

Developer responsibility
Review the schema and verify generated logic

Observed lesson
Our earlier generation attempt failed validation

Custom code and hybrid systems

Creator can support the operations interface
Forms, work queues and controlled review

Custom functions centralize business logic
One function can serve several workflow callers

External services need their own tests
Provider errors, duplicate requests and recovery

An eight-week learning plan

Weeks 1-2
Refine data modelling and Deluge validation

Weeks 3-4
Complete one authenticated service integration

Weeks 5-6
Test independent roles and stage a release

Weeks 7-8
Publish the case study and rehearse the demo

Professional readiness

A useful portfolio shows how the app behaves

Explain a business requirement and its implementation

Demonstrate a passing test and a handled failure

State remaining gaps clearly

Use certification to support practical experience
