EXPERIMENT 15

Report and Presentation on Career Pathways and the Future of Low-Code Development

Aim

Explain low-code career pathways, the skills needed for professional work and a practical portfolio plan based on the insurance application.

Record status

Report and companion presentation completed as a literature-based study and personal learning plan.

Concept

Low-code work combines process understanding with software engineering. A developer may spend less time constructing common interfaces, while still needing data modelling, access control, API integration and testing skills. AI assistance can propose designs and scripts, but the developer remains responsible for correctness and operating evidence.

Procedure

1. Study official Creator training, developer and certification pages. Use them to understand learning options without assuming that a certificate guarantees employment.

2. Map the insurance application to portfolio evidence: related forms, reports, Deluge validation, controlled workflows and clear test results.

3. Compare career roles and the artifacts each role should demonstrate. Build a focused portfolio case rather than claiming proficiency from screenshots alone.

4. Identify future directions from current platform capabilities: AI-assisted development, governed releases and custom-code integration. Label forecasts as analysis.

5. Prepare a concise presentation explaining roles, a learning plan, project evidence and the limits of the current prototype.

Application design and observations

Career pathway	Evidence a student can build
Low-code application developer	Related forms, reports, workflows and reproducible tests
Integration developer	OAuth connections, data mapping and failure handling
Business / process analyst	Requirements, process model and acceptance criteria
QA or platform administrator	Permission tests, release checks and recovery records
Solution architect, with experience	Tradeoffs, interface contracts and operating design

Suggested eight-week learning plan: weeks 1-2 refine data modelling and Deluge; weeks 3-4 implement one real authenticated integration; weeks 5-6 test roles and stage a release; weeks 7-8 publish a concise project case study and rehearse the demo. This is a proposed plan, not completed training. Avoid salary or demand estimates without a dated independent dataset.

Validation and discussion

Discussion question	Answer outline
Will AI remove all coding?	Current assistance still requires validation and custom logic
What proves job readiness?	A runnable project with tests and clear limitations
Why learn APIs?	Real applications exchange data with external systems
What should a portfolio disclose?	Simulation, incomplete integration and test coverage
How should certification be used?	As structured learning and supporting evidence

Result

The report identifies practical career paths and a skill-development plan. The companion presentation explains the same findings for an academic audience. Future directions are presented as reasoned expectations based on current features, with no guaranteed employment, salary or market-growth claims.

Viva focus

Explain your preferred role, portfolio evidence and one skill you will improve next.
