

EXPERIMENT 05b

Insurance Claim - Command Center Page

Aim. Build an operational insurance claim page combining claim overview, status work area, analytics, search, intake, report and document reminders.

Application: Insurance Claim Management

Record: Actual Zoho Creator screenshots captured on 06-07 Oct 2026. Sample claimants and policy details are fictional.

Evidence scope. This record describes the saved configuration and captured results. Any missing reference requirement is stated explicitly.

Command center overview

Create Claims_Command_Center_Page and add a native Panel. Command_Center_Main_Panel uses live form aggregates: Claim_Request_Form.ID.count and Claim_Amount_Requested.sum. Five saved fictional claims produce 5 and INR 166000. Requested exposure is the sum requested, not a reserve-fund balance.

Figure 1. Saved live overview, search, guidelines, reminder button and status summary.

Search by claimant surname

Claim_Search_Bar targets All_Requests. Its OR criteria search Policy Number, claimant first name, claimant last name and Claim Reference Code using contains(input.searchString). Results open in a popup. Entering Menon returns one matching claim, Dev Menon.

The screenshot displays the 'Insurance Claim Management' application interface. A sidebar on the left contains navigation links: 'Policyholders', 'Policies', 'Insurance Claims', 'Requests', and 'Claims_Communication_Page'. The main content area features a 'Claim Request Report' popup window. This window has a search bar and a table with the following data:

Claimant Name	Policy Number	Claimant Type	Claim Type	Date of Incident	Claim Amount Requested	Status
Dev Menon	DEMO-POL-1001	Policyholder	Motor	05-Oct-2026	38000	Under Investigation

Below the table, a pagination bar indicates 'Showing 1 of 1'. The application's top bar shows 'Trial expires in 13 days', 'Upgrade', 'Edit this application', and 'Help'.

Figure 2. Actual surname search result: Showing 1 of 1.

Embedded Kanban: before movement

The native Board provides grouped status counts. A separate embedded Claim Status Kanban report supplies the five draggable stages: Submitted, Under Investigation, Approved, Settled and Rejected. Before this test, Dev Menon is Under Investigation and Ananya Rao is Submitted. Empty stages can be reached by horizontal scrolling.

Figure 3. The Kanban report embedded inside the command center page.

Embedded Kanban: after movement

Drag the fictional Dev Menon card from Under Investigation to Submitted. The saved card appears in Submitted beside Ananya Rao. Move it back to Under Investigation after capturing the test. Zoho confirms Data updated Successfully and the embedded list reflects the restored status.

Figure 4. Actual changed stage, captured before restoring the original test status.

Monthly gauge, distribution chart and report

Monthly_Settlement_Target_Gauge counts claims with Status = Settled AND Status Changed On in this month. Maximum and target are 10; the current count is 0.

ClaimType_Distribution_Chart_Widget is a native pie chart using Claim Type and Count of Total Records: Motor 3, Health 1, Property 1. All_Requests is embedded below the intake button.

Figure 5. Saved side-by-side gauge and pie chart, intake control and embedded claim report; restored sample status is visible.

Quick claim intake

Quick_Counter_Claim_Intake_Form opens the existing Claim Request Form in a popup. The genuine form displays its claimant, contact, policy and other existing fields. No new claim was submitted for this test. This is a popup adaptation rather than the reference's expandable sidebar/tab form.

Verification and remaining work

Saved reminder setup. Send_Document_Reminder_Button calls the saved no-argument Deluge function SendMissingDocumentReminders. It considers Submitted and Under Investigation records, checks Policy Copy, motor estimate/photo/FIR and health medical-bill availability, and prepares email reminders for missing documents. The button was not executed; email delivery is untested.

Verified interactions. Live aggregate totals, surname search, embedded Kanban movement and restored status, and popup form opening are demonstrated. The chart counts all five saved records. The gauge uses a rolling current-month criterion; no settled sample exists for a positive-count test.

Reference adaptations. Native Board is an aggregate component; the draggable work area uses an embedded Kanban Report. Panel is an overview component, not a wrapper enclosing the entire page. The gauge uses the available arc display. Intake uses a popup.

Still incomplete. Surveyor availability and reserve widgets; automatic latest-document PDF/FIR viewer; fixed-interval chart refresh; red/green gauge ranges; fixed-top search positioning; central guidelines reuse; manager-only Excel export and Claims Team/Branch Manager access restrictions; a labelled full-builder capture of all eleven requested elements. The Viewer palette in this account offers AR/3D models rather than PDF documents.

Result and submission status. The operational core is saved and tested. This updated record is partial compliance with the supplied 5b reference and should not be labelled fully completed. Experiment number and aim appear only on the first page; subsequent pages contain explanatory text and genuine screenshots.
